| Project Name | Automated Network Request Management in ServiceNow |

Step-1: Problem Statement & Solution Scope

AUTOMATED NETWORK REQUEST MANAGEMENT

ServiceNow Individual Project - Solution Scope

Identified Challenge / Problem Statement:

- Manual, slow network service intake with zero requester tracking.
- High administrative effort validating incomplete and inaccurate requests.
- Unstructured manual approvals and risk of non-compliant network changes.

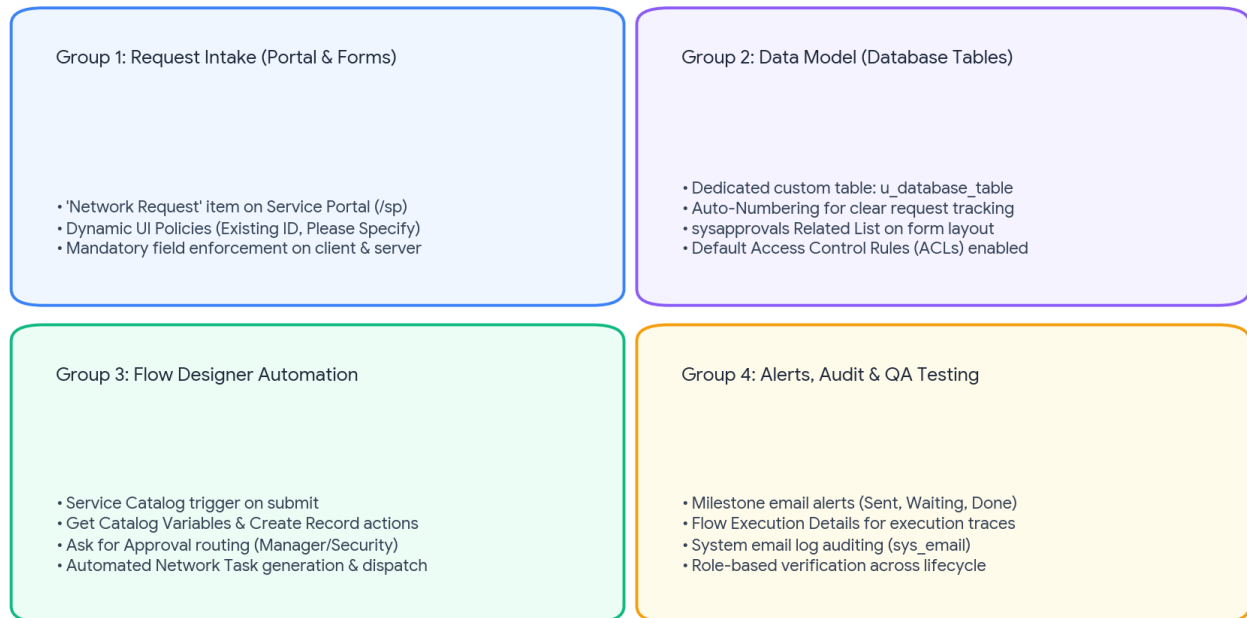

Core Objectives:

1. Self-Service Portal: Catalog item intake on /sp with dynamic UI policies.
2. Dedicated Data Model: Custom table 'Database Tables' (u\_database\_table).
3. Zero-Code Automation: Flow Designer for approvals, task dispatch, and alerts.
4. Complete Governance: Standard platform ACLs and related list approval audit.

- Problem Statement: Manual, paper-based, or email-driven network request submissions cause long turnaround times, lack real-time visibility, and create repetitive triage work for network engineers.
- Data Architecture: Store all captured request details in a dedicated custom table named Database Tables (u\_database\_table) with unique Auto-Numbering.
- Form Automation: Implement dynamic Catalog UI Policies to reveal context-sensitive fields only when needed (e.g., Existing ID, Please Specify).

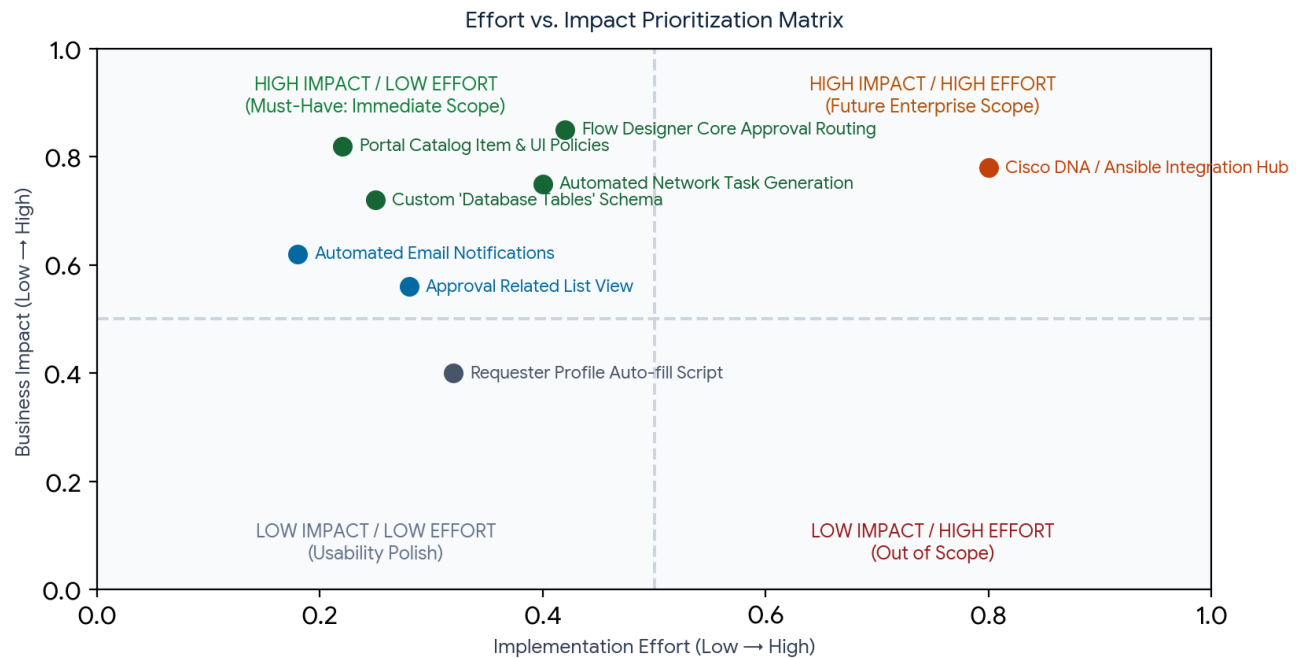

- Workflow Engine: Leverage Flow Designer for automated approval routing, milestone status updates, network task dispatch, and requester notifications without writing custom scripts.

## Step-2: Brainstorm, Idea Listing and Grouping

- Group 1 (Request Intake & UI): Service Portal (/sp) self-service item with mandatory validation and dynamic UI Policies.
- Group 2 (Data Architecture): Custom table Database Tables (u\_database\_table), default ACLs, and Related List for approval records.
- Group 3 (Process Automation): Flow Designer actions (Get Variables, Create Record, Ask for Approval, Update Record) and fulfillment task dispatch.
- Group 4 (Governance & Logs): Multi-stage email notifications, Flow Execution logs, and role-based verification across the request lifecycle.

## Step-3: Idea Prioritization

| Priority Tier           | Implementation Item                                                 | Impact | Scope Decision             |
|-------------------------|---------------------------------------------------------------------|--------|----------------------------|
| <b>Must Have (P1)</b>   | Service Portal Catalog item with dynamic Catalog UI Policies        | High   | Implemented immediately    |
| <b>Must Have (P1)</b>   | Custom table Database Tables (u_database_table) with Auto-Numbering | High   | Implemented immediately    |
| <b>Must Have (P1)</b>   | Flow Designer logic: dynamic approvals & network task generation    | High   | Implemented immediately    |
| <b>Should Have (P2)</b> | Automated multi-stage email notifications (Requester & Approver)    | High   | Implemented in workflow    |
| <b>Should Have (P2)</b> | Approval Request Related List added to Database Tables form         | Medium | Implemented on form layout |

|                        |                                                                |        |                           |
|------------------------|----------------------------------------------------------------|--------|---------------------------|
| <b>Could Have (P3)</b> | Auto-populating requester profile details via client script    | Medium | Included as phase polish  |
| <b>Won't Have (P4)</b> | External orchestrator integration (Cisco DNA Center / Ansible) | High   | Future enterprise roadmap |
