

Customer Experience & Service Design Phase

Customer Journey Map: Automated Network Request Management

Date	03 October 2026
Developer / Student	Vinay Krishna A K
Project Name	Automated Network Request Management in ServiceNow

Stage / Dimensions	1. Entice (Discover)	2. Enter (Fill & Submit)	3. Engage (Approval Gate)	4. Exit (Fulfillment)	5. Extend (Wrap-up)
Steps & Experience (What the user does)	User needs network access or a new device setup for project work, so they open the ServiceNow Service Portal (/sp).	They click on 'Network Request', pick their options, and dynamic fields pop up (like 'Existing ID' or 'Please Specify').	They hit Submit. The Flow triggers, saves the data into 'Database Tables' (u_database_table), and emails the approver.	The manager or security team approves it. Flow Designer automatically creates a fulfillment task for the Network Team.	The network engineer finishes the work, marks the task done, and the user gets a final completion email.
Interactions (People, Places, Things)	People: User Places: Service Portal (/sp) Things: Laptop browser, search bar	People: User Places: Request Form Things: Dynamic fields, drop-down options, submit button	People: Manager / Approver Places: Email inbox, Portal approval page Things: Flow Designer approval action	People: Network Team Places: ServiceNow backend workspace Things: u_database_table, network task	People: User & IT Admin Places: Email inbox, Portal ticket view Things: Status update email, ticket record
Goals & Motivations ('Help me...')	Help me find where to request network access easily without asking around or	Help me fill out only the fields I need without getting confused by technical	Help me get my manager to approve it quickly without having to chase them.	Help me get my network setup finished on time so I can continue my work.	Help me know that the request is officially closed and my connection is ready to use.

	writing emails. terms.				
Positive Moments (What feels good)	Finding the Network Request link right away on the Service Portal main page.	Fields only show up when needed, which makes the form simple and quick to fill out.	Getting an instant email receipt with a ticket number so I know it went through.	No waiting for manual ticket assignment; it goes straight to the network engineers.	Getting an email right when it is completed so I can start using the connection.
Negative Moments (Frustrations)	Worrying that this will take days to get approved like old manual requests did.	Not knowing exact technical values like IP address or specific device type.	Waiting if the manager forgets to check their email or is out of office.	Wondering if someone is actively working on the task or if it is just sitting there.	Having to manually test if the network is working after receiving the completion email.
Areas of Opportunity (Ideas to improve)	Put the Network Request item right under 'Featured Services' on the home page.	Auto-fill my name, department, and desk location so I have to type less.	Add an automatic reminder email if the approver doesn't respond within 24 hours.	Show a simple progress bar on the portal ticket page (Submitted -> Approved -> In Progress -> Done).	Look into future automation tools like Ansible to configure devices automatically.
