

## Ideation & Design Phase

# Problem - Solution Fit Canvas

Date

03 October 2026

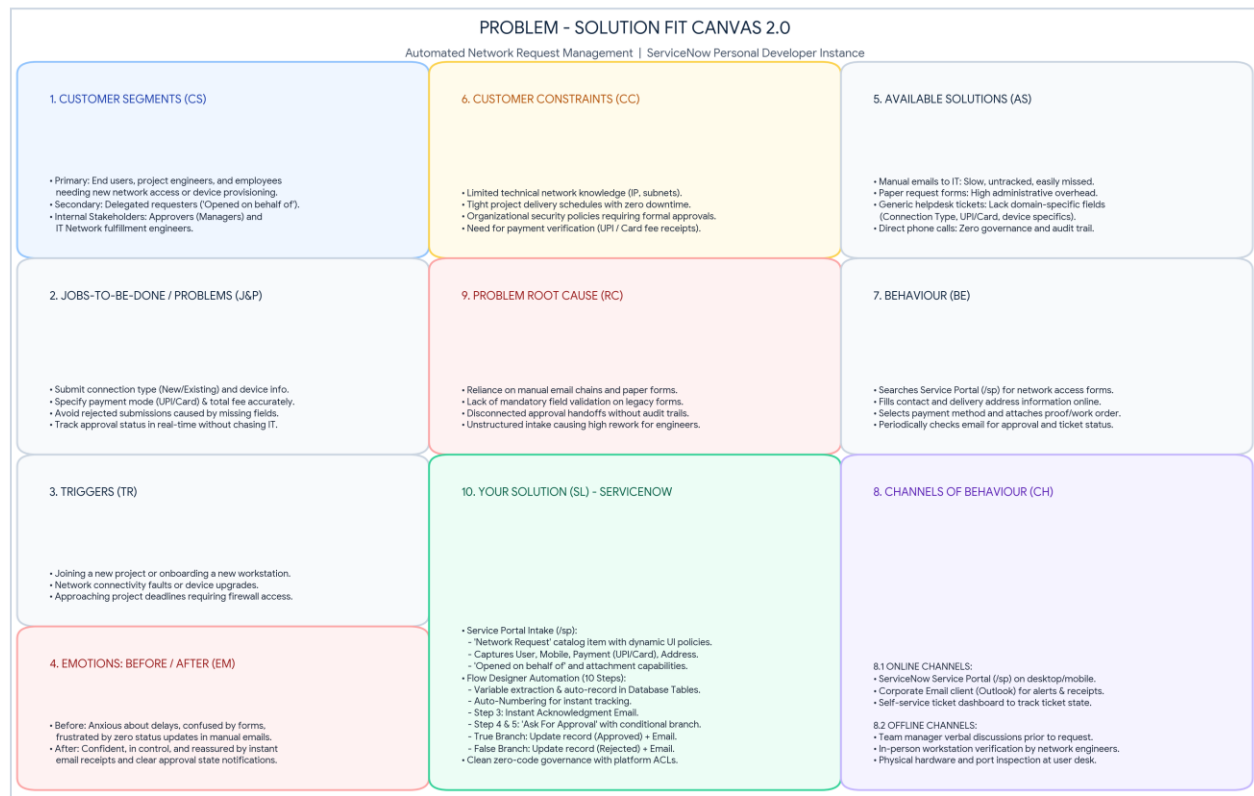

Developer / Student

Vinay Krishna A K

Project Name

Automated Network Request Management in ServiceNow

## 1. Problem - Solution Fit Canvas 2.0

## 2. Canvas Dimensions Breakdown (ServiceNow Implementation)

| Section No. | Canvas Dimension           | ServiceNow Project Analysis & Configuration                                                                                                                                                                                              |
|-------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. CS       | Customer Segment(s)        | End users, employees, and engineers needing network access or device setup. Includes delegated requesters ('Opened on behalf of') and line managers acting as approvers.                                                                 |
| 2. J&P      | Jobs-To-Be-Done / Problems | Submit network connection details (New/Existing), calculate Total Amount, choose Mode of Payment (UPI/Card), provide delivery Address, and receive timely approvals without administrative delays.                                       |
| 3. TR       | Triggers                   | Starting a new project, joining a team, relocating workstations, encountering network connection issues, or needing authorized port access.                                                                                              |
| 4. EM       | Emotions (Before / After)  | Before: Anxious about missing project deadlines, confused by complex legacy procedures, and stressed by unacknowledged emails.<br>After: Reassured, in control, and confident due to instant acknowledgment emails and visible progress. |
| 5. AS       | Available Solutions        | Manual email threads to IT engineers, physical paper request forms, and generic incident tickets. Drawbacks: zero automated approval routing, missing fields, and high triage overhead.                                                  |
| 6. CC       | Customer Constraints       | Lack of technical network expertise, strict security compliance policies, reliance on line-manager sign-offs, and requirement of valid payment modes (UPI/Card).                                                                         |
| 7. BE       | Behaviour                  | Opens the corporate portal, searches for network items, fills in required contact/connection details, attaches documents, and checks email for status updates.                                                                           |
| 8. CH       | Channels of Behaviour      | Online: ServiceNow Service Portal (/sp), automated email notifications, and self-service request status widgets.<br>Offline: Direct manager discussions and on-site hardware setup by network engineers.                                 |
| 9. RC       | Problem Root Cause         | Absence of an integrated, automated intake and workflow engine. Legacy systems lacked mandatory validation,                                                                                                                              |

dynamic field rules, and automated database record creation.

**10. SL**

Your Solution (ServiceNow)

Service Portal Catalog Item (/sp) with dynamic Catalog UI Policies, custom relational schema Database Tables (u\_database\_table) with Auto-Numbering, and a 10-step Flow Designer automation routing approvals, setting record states, and sending automated emails.
